

# Aerodynamic Shape Optimization in the Conceptual and Preliminary Design Stages

Arron Melvin

Adviser: Luigi Martinelli

Princeton University

FAA/NASA Joint University Program for Air Transportation

Quarterly Review

Ohio University

June 19, 2003

# Outline

- Aerodynamic Shape Optimization
- Present examples of use of design codes
  - Subsonic General Aviation Plane
  - Supersonic Business Jet
- Summary
- Work Plan

# Motivation for Automatic Design

- Aerodynamic development typically “cut&try”
  - Slow (design time doing detailed design iterations)
  - Expensive
  - Relies on physical insight of designer for changes
- Automatic design to reduce time spent in detail design phase
  - Improved performance
  - Decreased costs

# Aerodynamic Shape Optimization

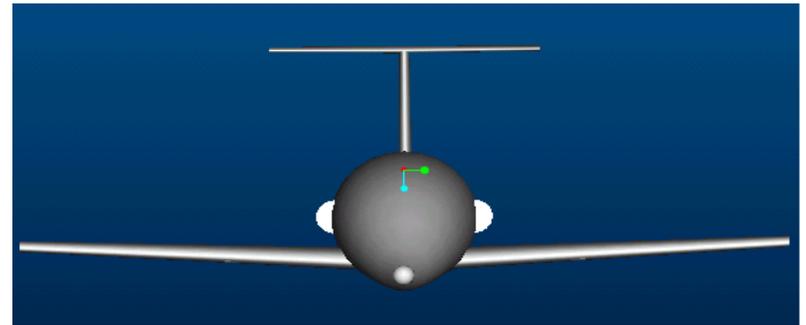

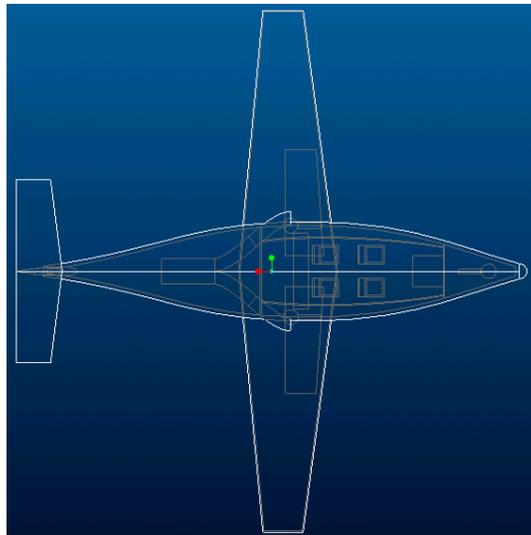

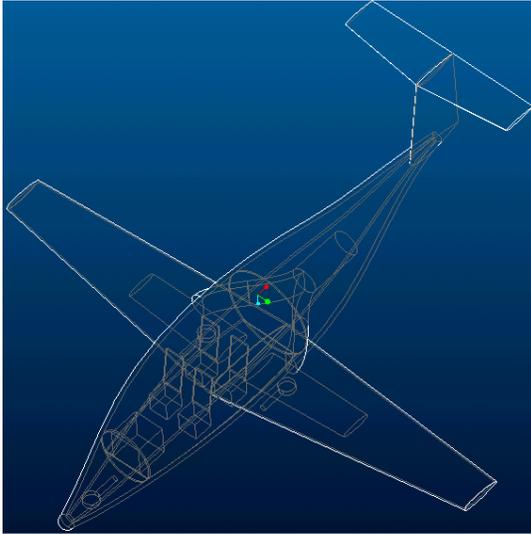

- Large number of design variables necessary for complete aircraft
- Control theory - gradient requires only the solution of an adjoint system
- Gradient calculation independent of the number of design variables

# General Aviation Design Specifications

- Cruising Speed: Mach 0.5, 25,000 ft
- Range  $>$  1000 nautical miles
- Takeoff Field Length  $<$  2000 ft
- Stall Speed  $<$  60 knots (sea level)
- Climb Rate  $>$  2500 ft/min
- 4 Passengers + Luggage : 1050 pounds

# Pro/E Layout

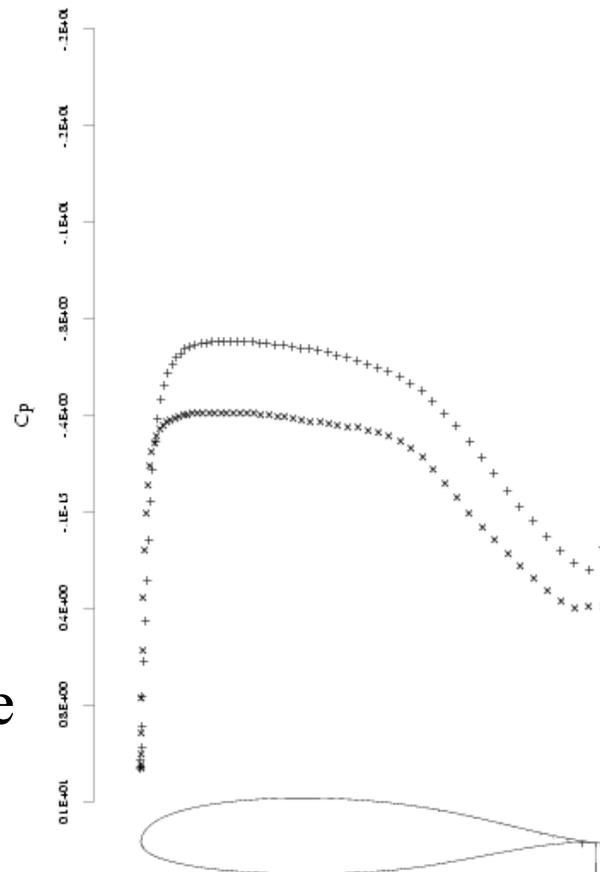

Reference: Neil McCann

# Aerodynamic Design Procedure

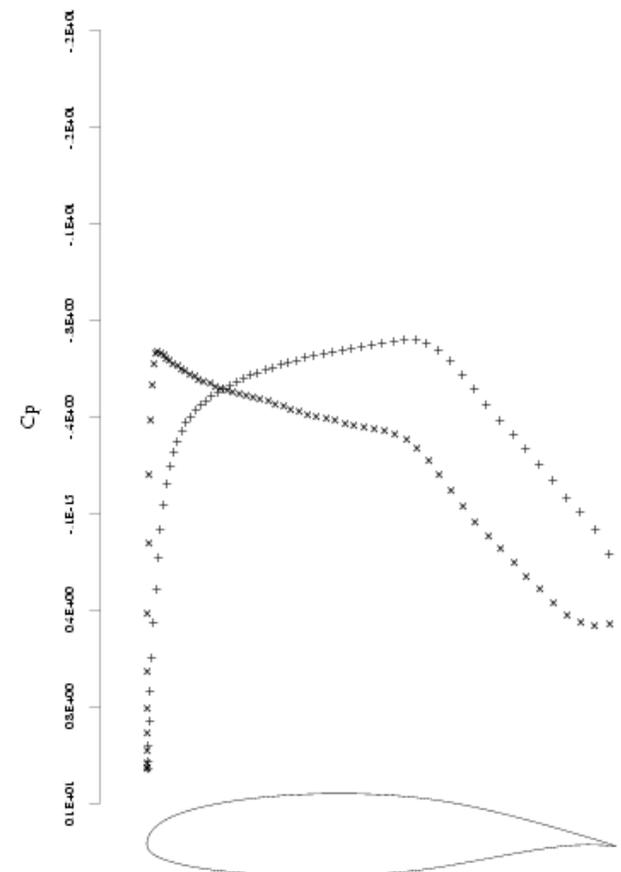

- 2D Section Design (SYN83)
  - Inviscid, automatic structured mesh
- 3D Clean Wing (SYN88)
  - Inviscid, automatic structured mesh
- 3D Wing/Body (SYN88)
- 3D Full Configuration (FLOPLANE)
  - Inviscid, unstructured mesh

# 2D Section Results

- Started with a GAW airfoil
- 40 design cycles
- Drag reduced from 15 counts to 9 counts
- <1 hour wall time

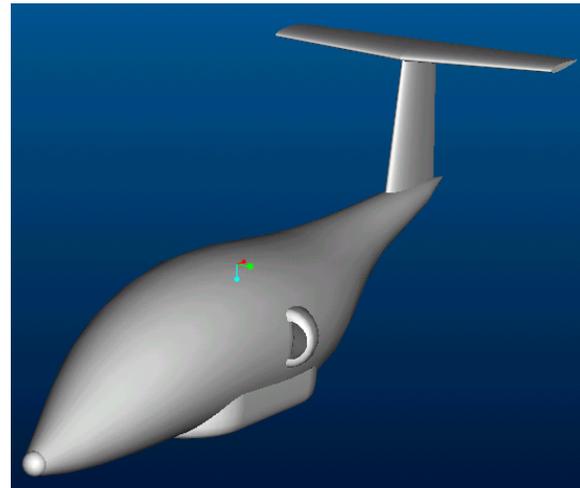

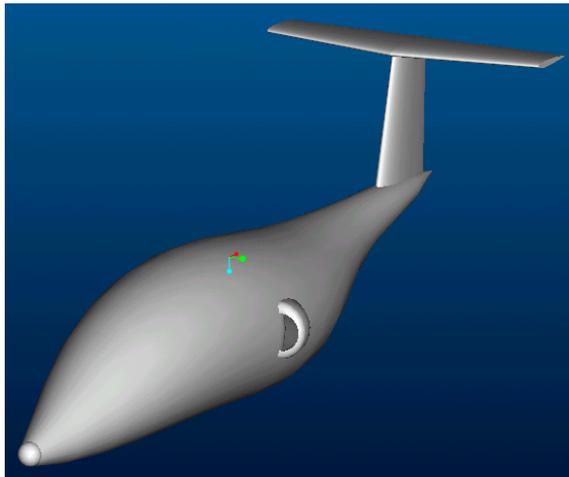

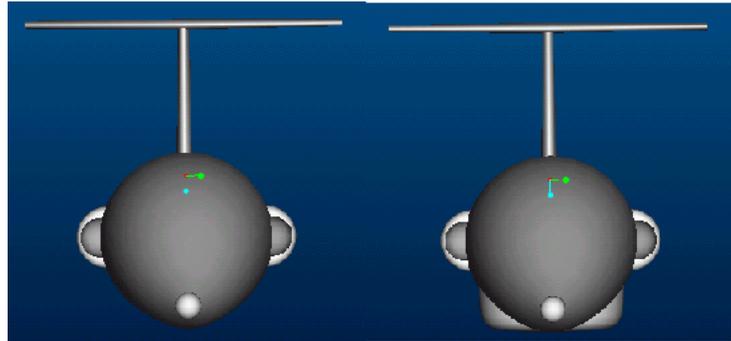

GAW AIRFOIL  
MACH 0.500 ALPHA -0.816  
CL 0.2480 CD 0.0209 CM -0.0680  
GRID 102X32 1IDES 40 RES0.170E-03 GMAX 0.668E-04

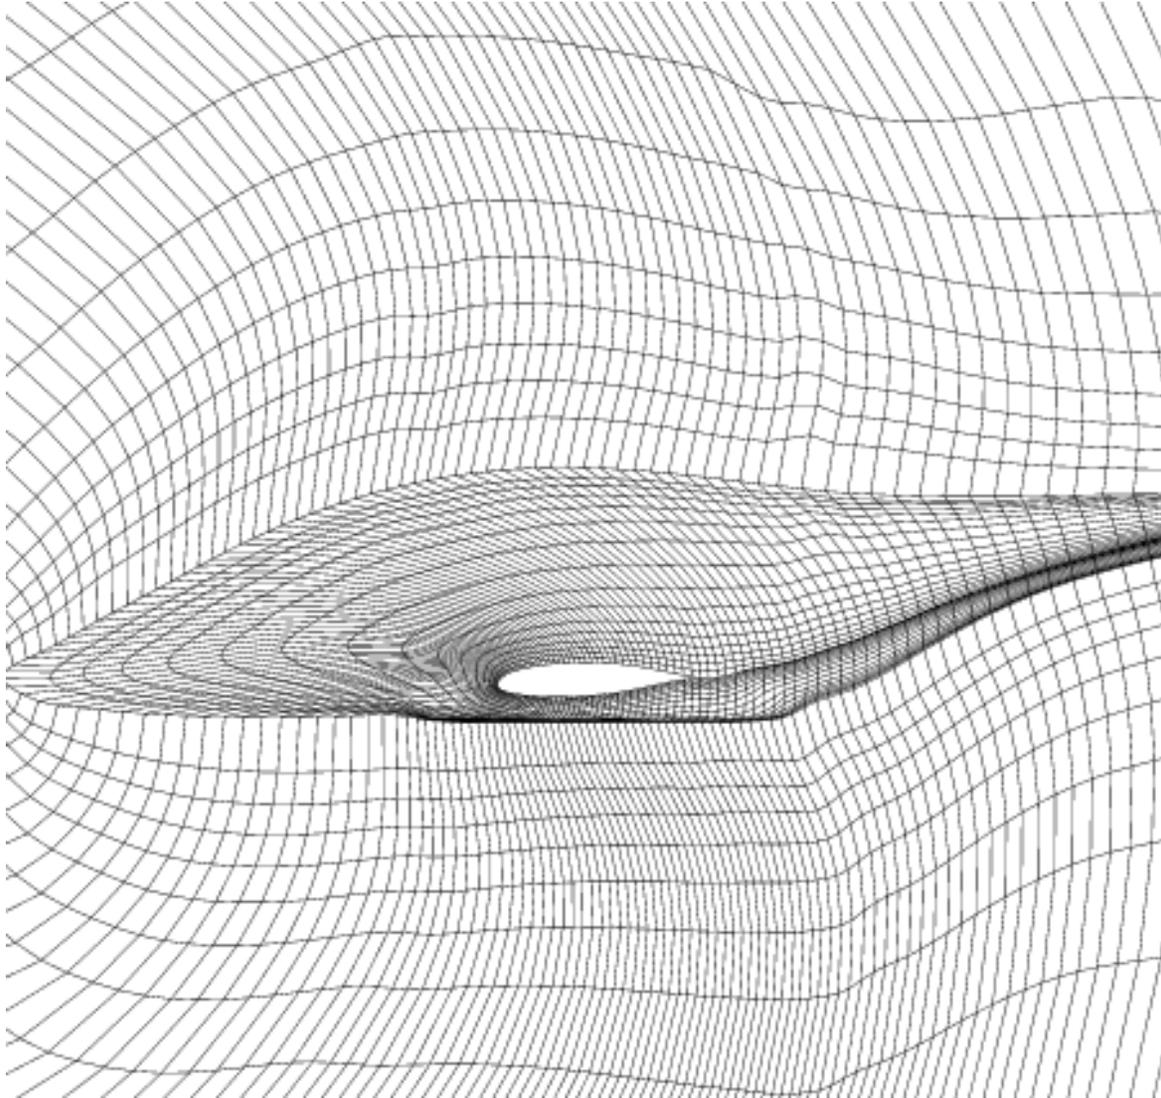

GAW AIRFOIL  
MACH 0.500 ALPHA -1.805  
CL 0.2508 CD 0.0015 CM -0.1376  
GRID 102X32 1IDES 0 RES0.133E-03 GMAX 0.100E-05

# Fuselage Modification

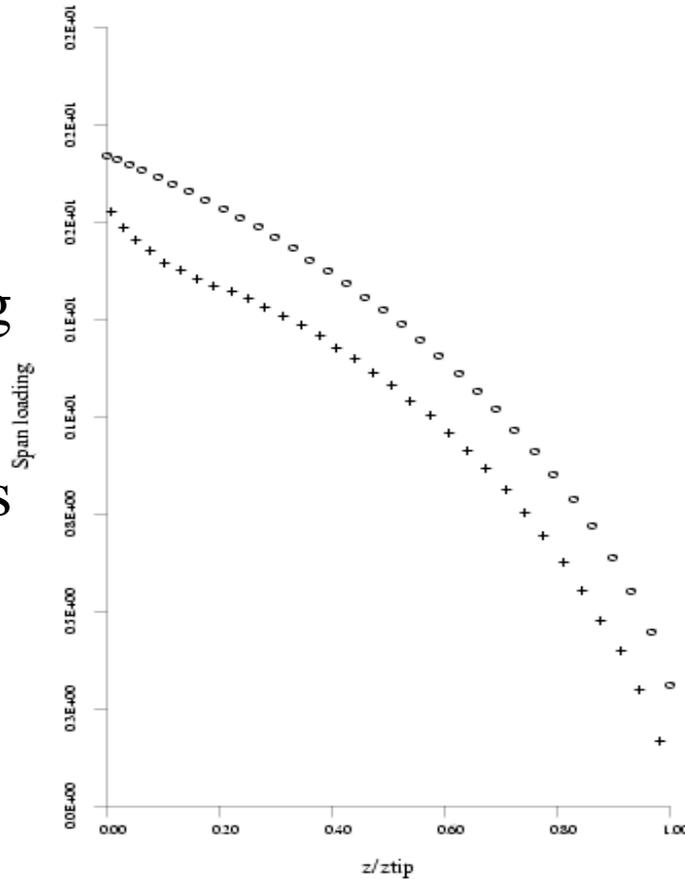

Reference: Neil McCann

# 3D Wing/Body Mesh

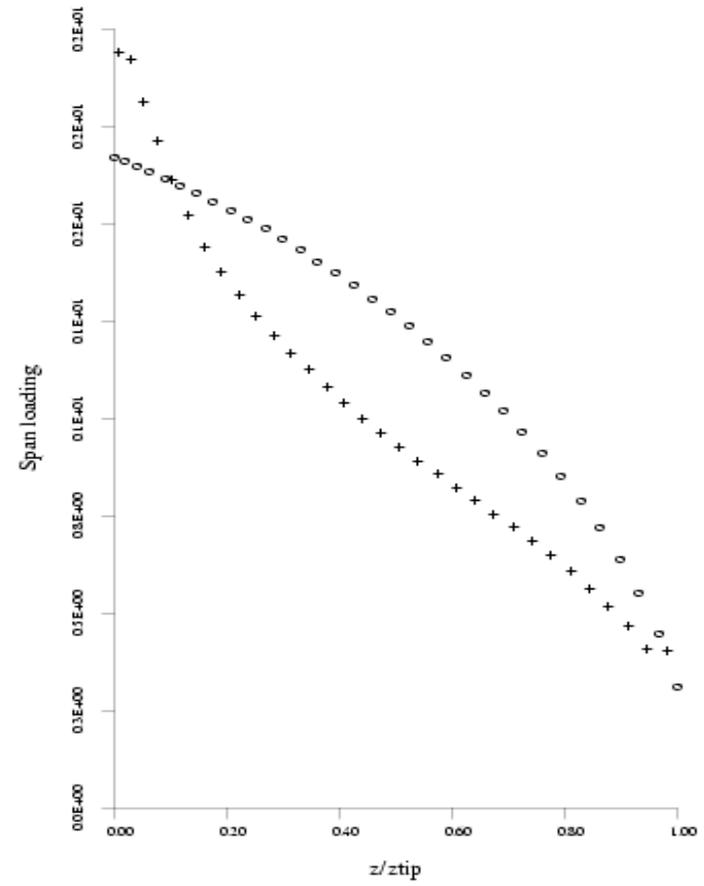

# 3D Wing/Body Results

- 6 design cycles
- Span loading corrected
- Drag savings of 9 counts (54 total)
- 6 hour wall time

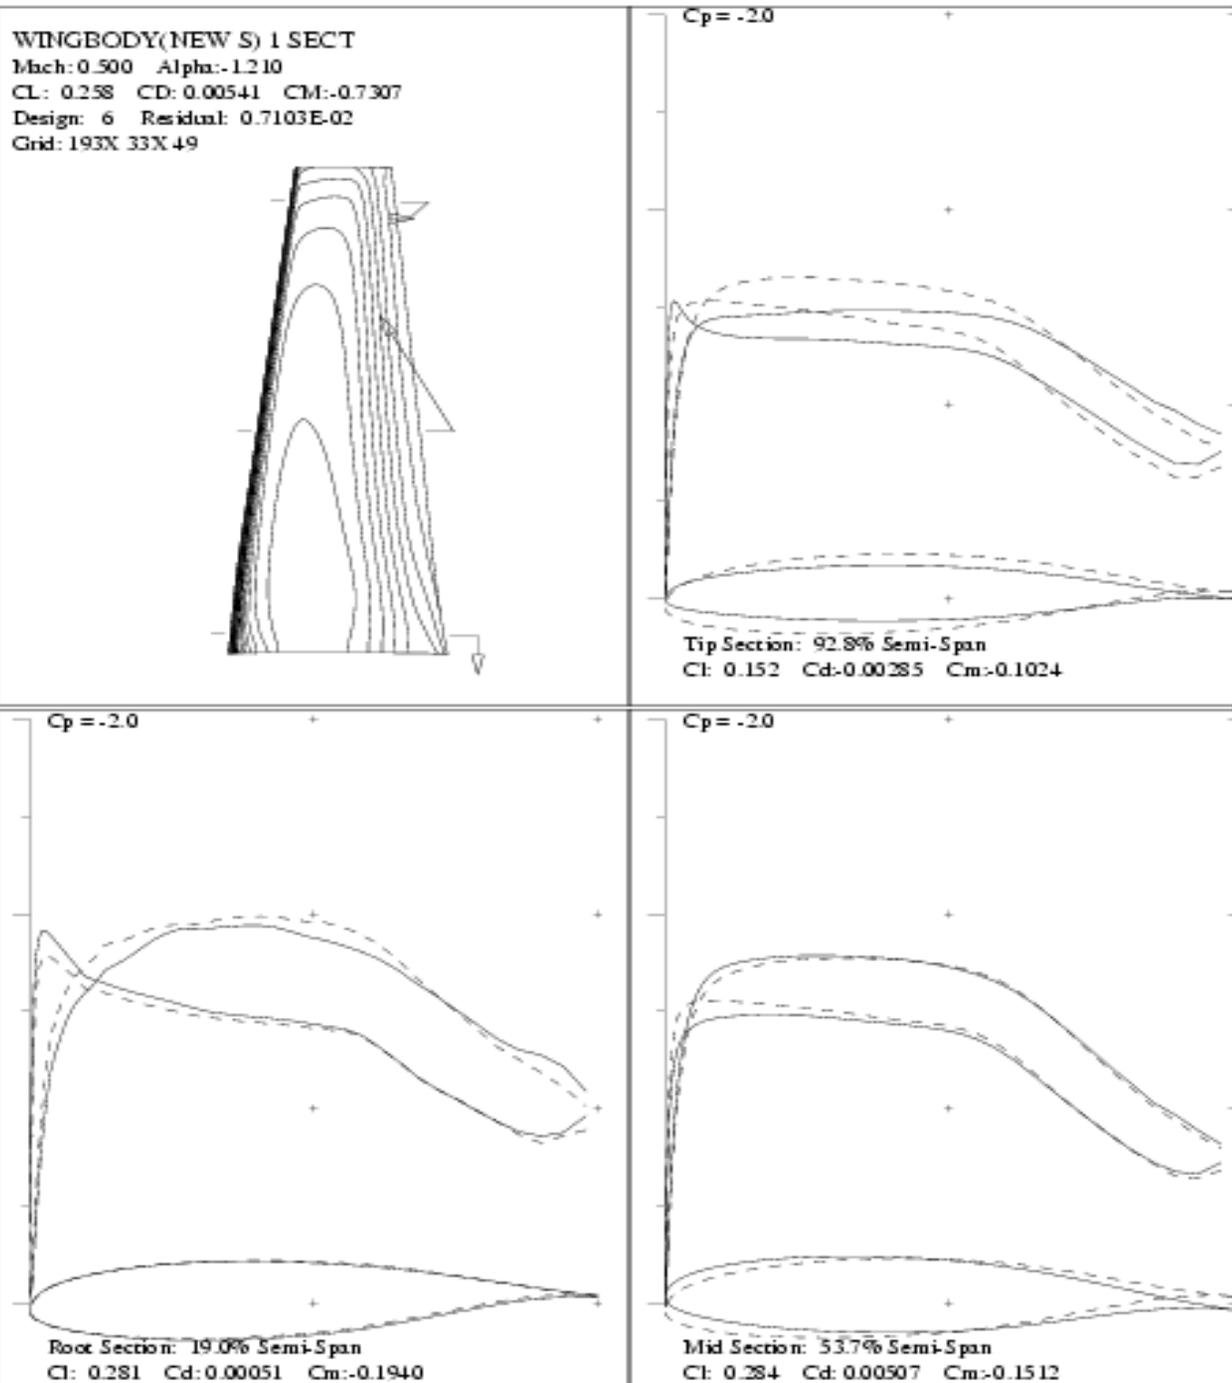

WINGBODY(1IEW S) LS BCT  
MACH 0.300 ALPHA -1.310  
CL 0.2582 CD 0.0054 CM -0.7307

# Planform & Sectional View of Wing/Body Design

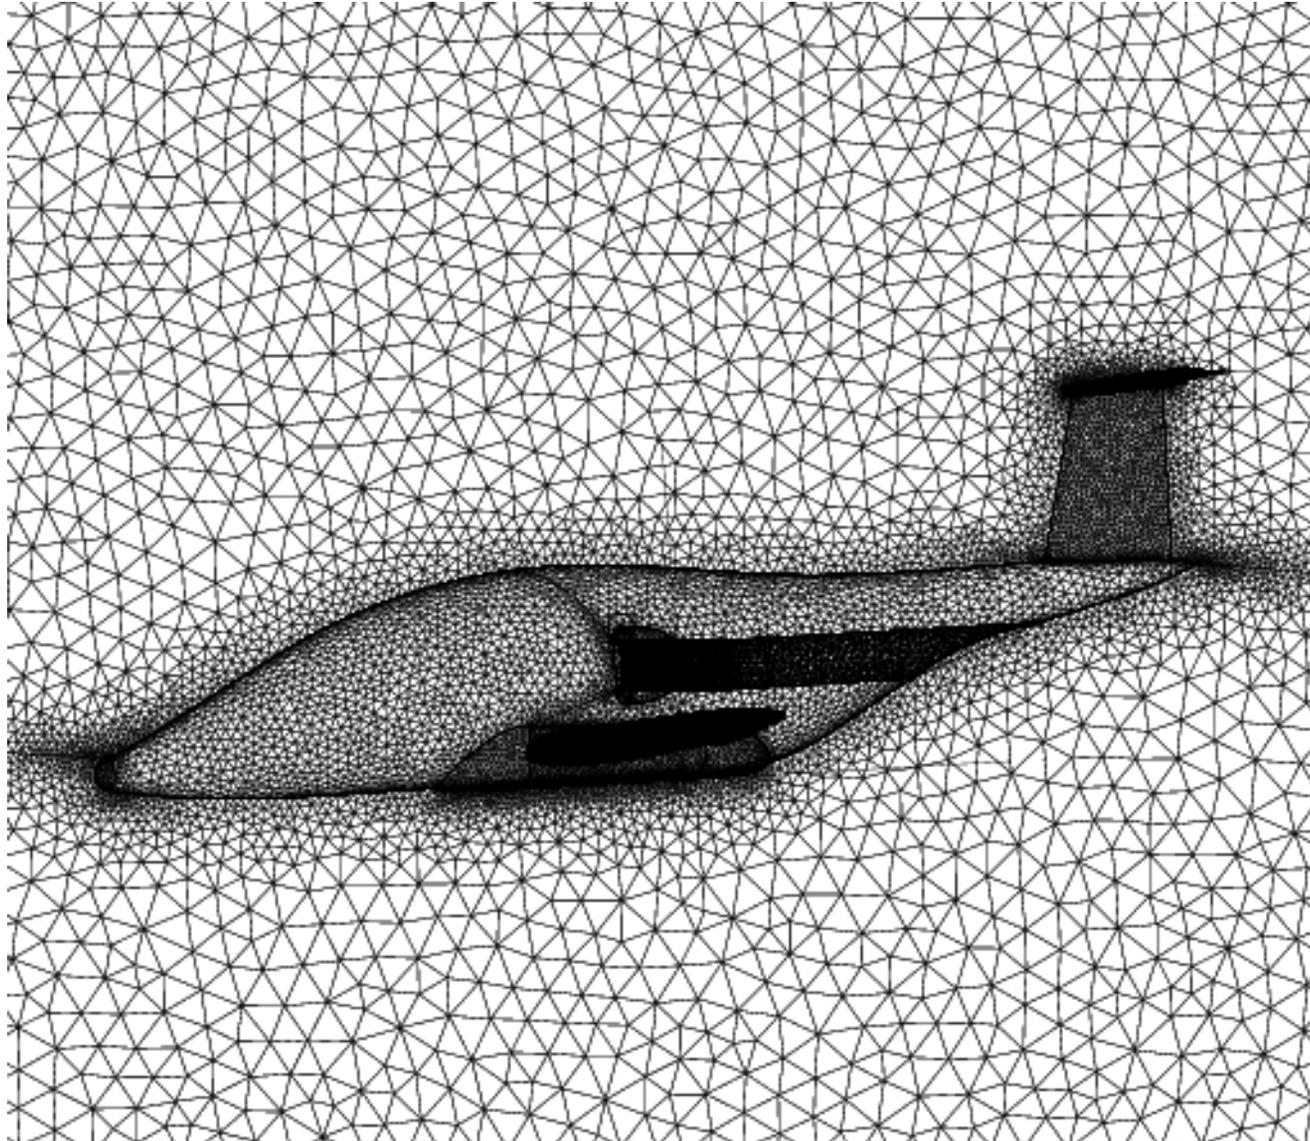

- 6 design cycles
- Tip sections thinned
- Root thickened

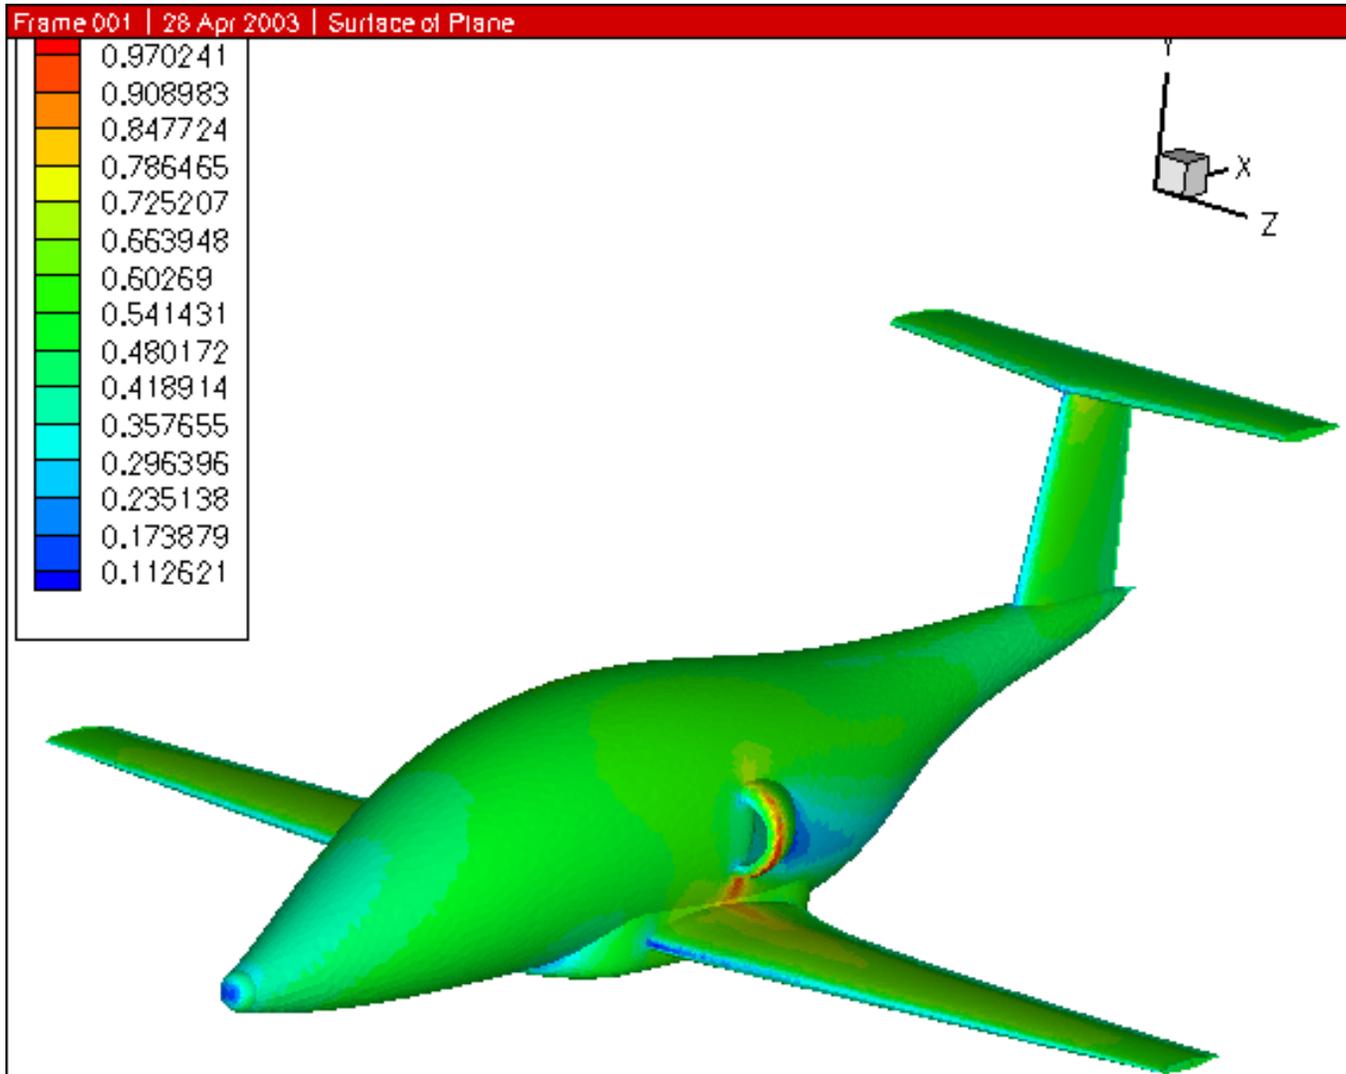

# Full Configuration Analysis

- FLOPLANE
  - Inviscid
  - Unstructured tetrahedral mesh
- Surface mesh created with Gridgen
- Volume mesh created with MESH3D
- Simulated flight at  $M = 0.5$ , 25,000 ft
- Half configuration
- 2.5 Hour wall time

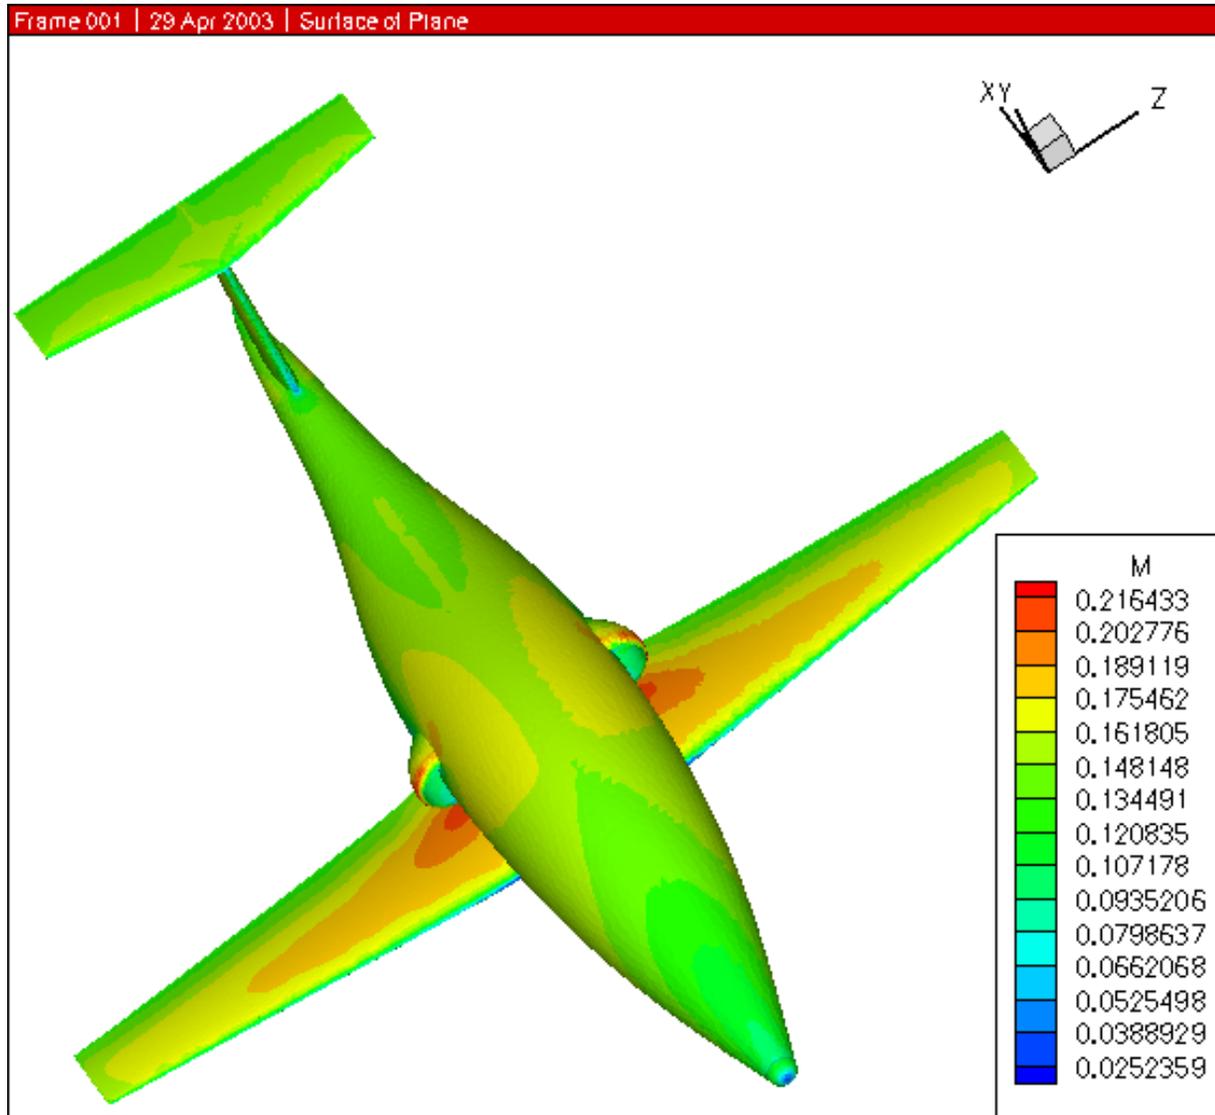

# Unstructured Surface Mesh

# Mach Contours, Cruise (M=0.5, $\text{aoa} = 0$ deg.)

# Mach Contours, s.l. (M=0.15, $\text{aoa} = 0$ deg.)

# Design Issues

- Drag prediction discrepancy
  - SYN88: 54 counts
  - FLOPLANE: 1080 counts
- Aerodynamic lessons
  - Significant lift from cambered fuselage
  - Wing/body interaction is highly important
- Geometry definition & meshing is bottleneck

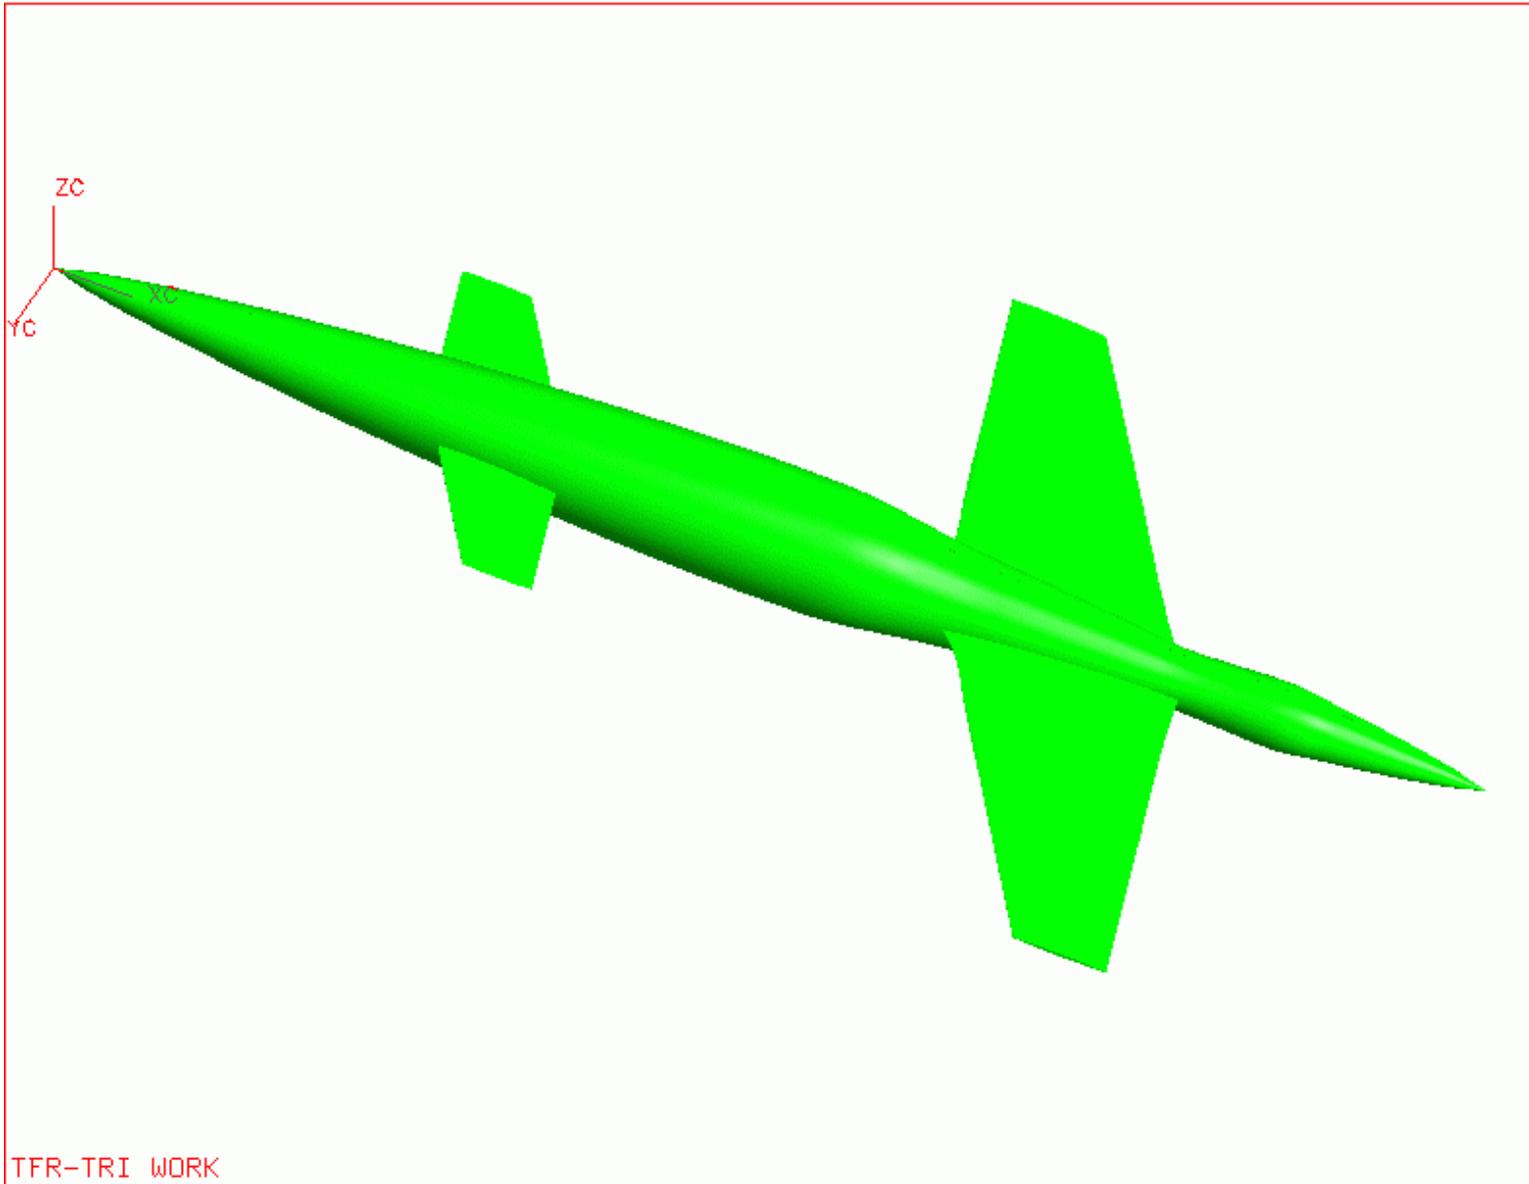

# Quiet Supersonic Platform Design Objective

- Supersonic business jet
  - 20 passengers
  - Cruise speed: Mach 2.4
  - Cruise altitude: 60,000 ft
  - Range: 6,500 nautical miles
  - Maximum weight: 100,000 pounds

# Conceptual Design Layout

- Symmetrical tapered wing canard configuration
  - Laminar boundary layer
    - Supersonic leading edge
    - Small root chord
    - Minimal cross-flow effects
      - Sweep
      - Twist

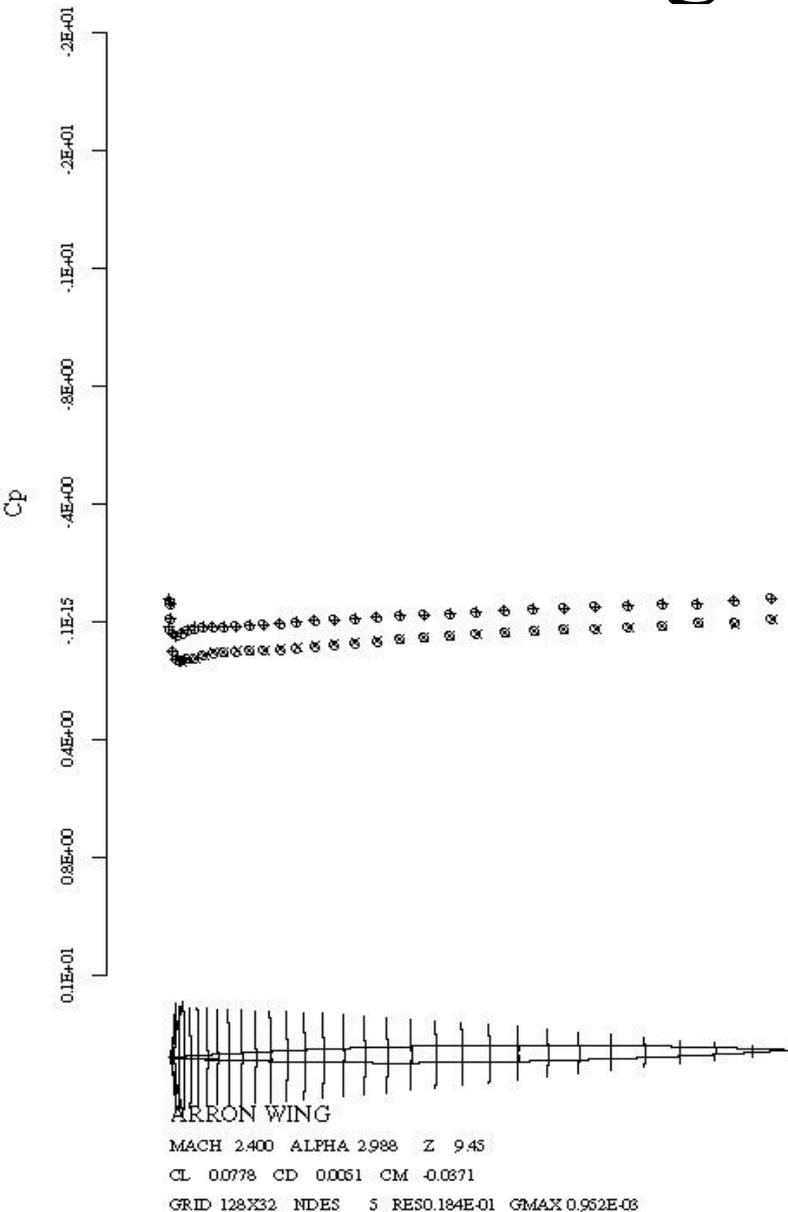

# Pro/E QSP Wing/Body Model

# QSP Main Wing Design

- Initial analysis: wing alone at cruise
- 3 planforms considered
  - Similar performance at cruise
  - Differences for transonic flight
    - Long span with constant  $10^\circ$  taper

# Wing/Body Optimization

- 5 design cycles, single-point
- Mild pressure gradient
- Shape optimization thins wing

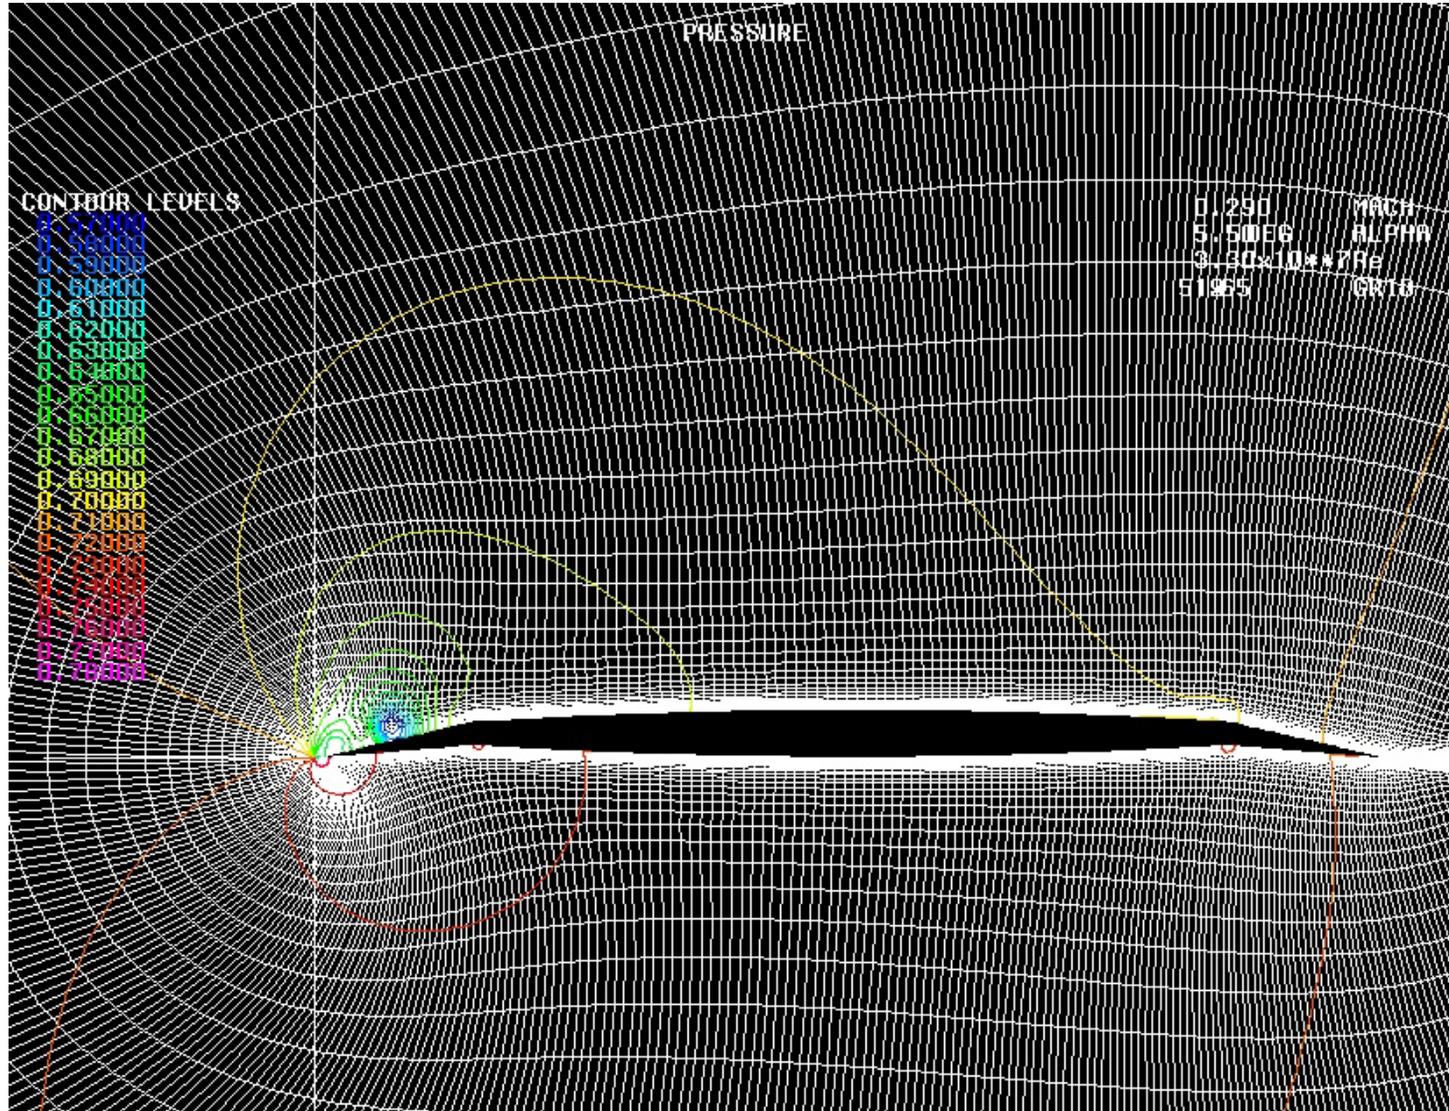

# Aerodynamic Performance Estimates

	<b>Cruise</b>	<b>M=0.9, 30,000 ft</b>	<b>M=0.5, 20,000 ft</b>
<b>Wing/Body CL</b>	<b>0.0943</b>	<b>0.1735</b>	<b>0.3633</b>
<b>Wing/Body Cdform</b>	<b>0.007</b>	<b>0.0028</b>	<b>0.0205</b>
<b>Wing/Body AOA</b>	<b>2.95</b>	<b>1.69</b>	<b>4.5</b>
<b>Total L/D</b>	<b>7.44</b>	<b>17.32</b>	<b>13.57</b>

Weight = 350,000 N

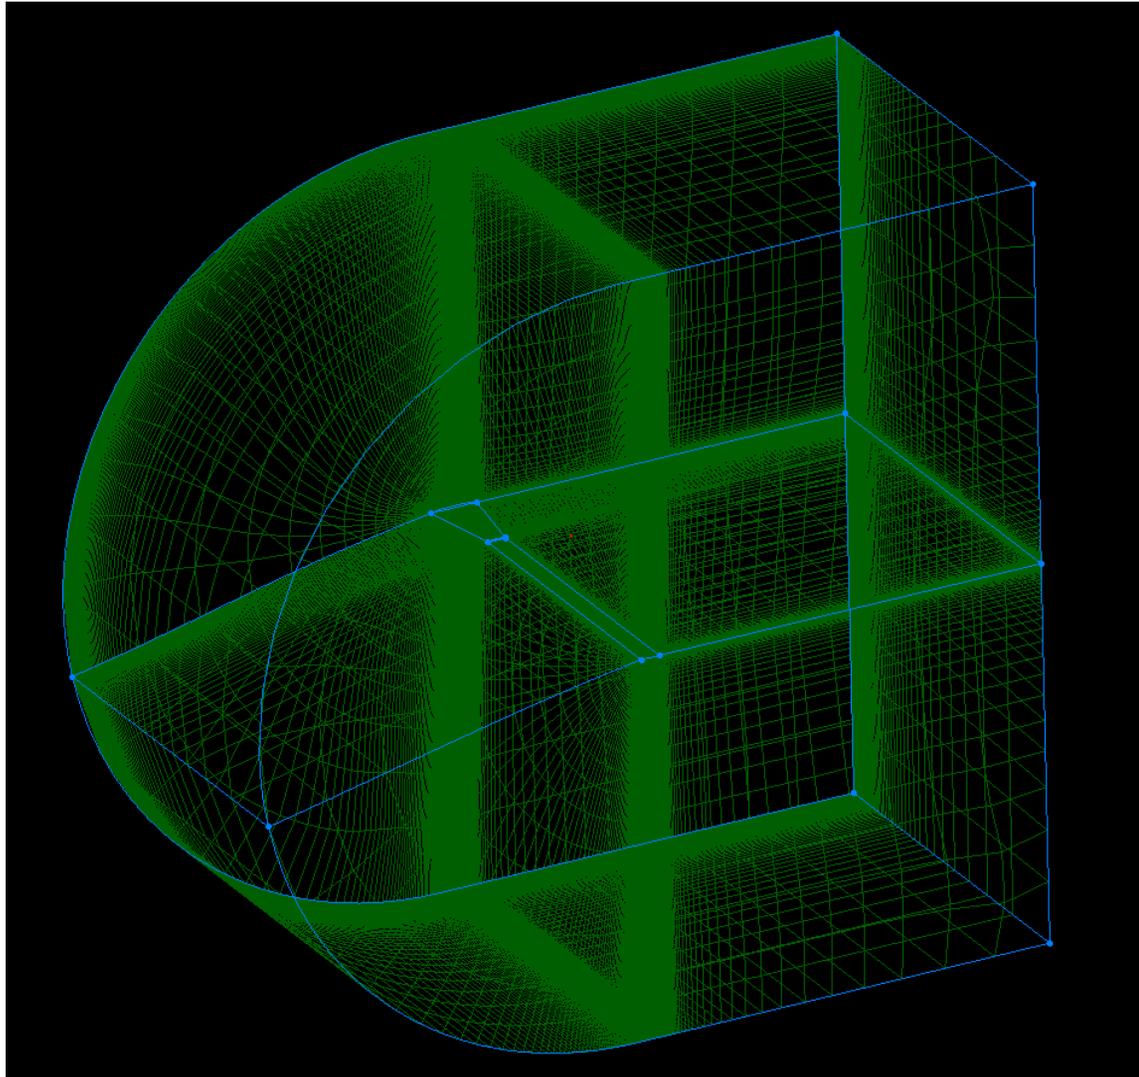

(Viscous drag calculated with flat plate boundary layer)

# High-Lift 2D Section

# High-Lift Wing

Gridgen C-mesh for SYN88

# Concluding Remarks

- Useful design tool
  - allows more time for creativity
- Useful teaching tool
  - wing/body interaction
  - multipoint design demonstrates conflicting requirements of different modes of flight
- Need for fast and efficient mesh generation
  - ⤴ Unstructured Meshes
